

12/13/2019:

numbers are not a valid variable name and no special characters allowed

Course Number:

Capital letters are initializing classes and not variables

best grade ever:

space are not allowed to declare things in java

programming-SS2019:

no special chars are allowed by variables

5th Attestation:

no numbers on the beginning of a variable

fußgröße (German word for foot size):

no umlaut is allowed in variables

greatest common divisor:

every following word in capital letters for better reading

netto+VAT:

no plus sign to connect to words

p:

p it's not a strong name no information

Why should you never store the age of a child in years in an application, for example as data type int? How would you better manage this information? What data type could fit?

because int has only natural numbers but a child is able to be 17,7 years old, also the value is initialized with a value and after an year it is incorrect

Enter meaningful declarations (name and type) for the following variables:

look at program code
